

PRECAFIL

SURFACE PRE-COATING POWDER

The pre-coating powder creates a precoat of powder on the surface of the liner, preventing the penetration of particles into the felts.

Precafil powder optimises filtration efficiency.

Precafil absorbs moisture and hydrocarbons, preserving the performance of sparks.

Precafil optimises filtration efficiency by balancing the differential pressure.

Precafil extends the service life of the filter bags.

Precafil lowers the emissions to the atmosphere, improving the data in the results of the chimneys.

The quantities of product to be used are calculated on the basis of the filtering surface of the fabric (Consult).
